Ethanol has a naturally high-octane rating — 113 — and improves engine performance while keeping engines running cooler.

**ENGINE PERFORMANCE**

Ethanol’s naturally high-octane rating (113 octane vs 87 octane for gas without ethanol) provides extra power — meaning that modern engines can achieve a fuel efficiency gain from mid-level blends. Worldwide fuel economy standards for vehicles are increasingly becoming more stringent. Automobile manufacturers are being forced to move toward higher efficiency engines that require high-octane fuels to operate effectively and lower greenhouse gas emissions. Ethanol continues to be one of the most valuable and competitive sources of octane in the world. Also, because ethanol lowers greenhouse gas emissions, it provides substantial benefits to automobile manufacturers, consumers, and the environment.

**THE FACTS**

- Since adopting the E15 in 2011, NASCAR has logged well over 10 million miles on the fuel blend. And American motorists have driven more than 10 billion miles on E15.
- Ethanol is a renewable biofuel produced from grains, plants, and grasses. It also burns cleaner than oil, which is good for our environment.

**SMALL ENGINE USE**

Standard E10 ethanol blends are safe and approved for use in all engines including boats, motorcycles, and outdoor equipment. Under federal law, some small equipment should not be fueled with higher blends, and that is why all E15 pumps are clearly labeled.

- In June 2017, Growth Energy released a survey showing that U.S. small engine owners are pleased with the performance of their fuel and find it easy to pick the best option.
- A Growth Energy poll of 500 motorcyclists found that 96 percent of motorcyclists find it easy to figure out the type of gasoline to put in their engine, and 90 percent thought it was important to have choice at the pump. A third survey found that 94 percent of U.S. boat owners find it easy to pick the right fuel and are confident in their selection.
