

WAYS TO OFFER E15, UNLEADED 88

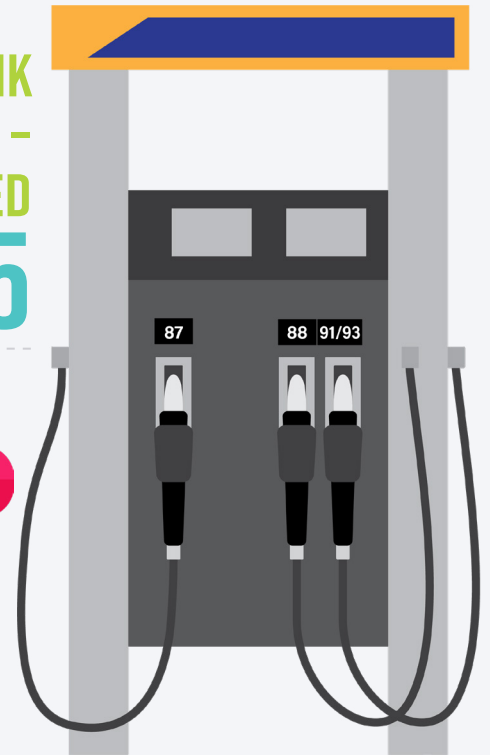

DUEL HOSE BLENDER

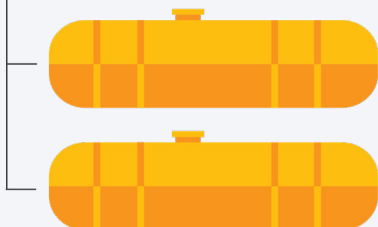

This is a blender pump with 3 tanks, utilizing the 87 and E85 tanks to create the E15 (Unleaded 88). E85 is available on the left for flex fuel vehicles, and the right hose dispenses 88, 89, and 93.

Adopting E15 is oftentimes easier than retailers think, depending on infrastructure already set in place. Many retailers can utilize their current infrastructure and purchase pre-blended E15, which also reduces the cost immensely for new infrastructure. E15 can represent more than 50 percent of total gasoline sales using best practices.

THREE TANK SYSTEM - PREBLENDED E15

E15 (Unleaded 88) is purchased, pre blended and put directly into a tank underground then piped straight to the UNL88 hose on the dispenser.

TWO-TANK SYSTEM

The two-tank system is the most common system. This is an example of a blender pump with 2 tanks. In this case, E15 (Unleaded 88) replaces E10/87. Products sold at the dispenser would be 88, 89, 93.
